

ABSTRACT

A removal cleaning agent for discolored sections of titanium building materials which comprises at least a
5 water-soluble inorganic acid salt, an organic acid or organic acid salt, a surfactant and a hydrophilic oxygen-containing hydrocarbon solvent, and optionally an discoloration inhibitor, fluorocarbon resin and polishing material. In the cleaning method for
10 discolored sections of titanium building materials, coating is carried out with a bristle brush and a sponge roller, the coated film sections are polished with a nonwoven fabric or foam resin, optionally after aging, and then the discolored sections are removed by washing
15 with water.
